

AUSTimber is the opportunity for demonstrating, discussing and dreaming up the technologies that improve productivity and sustainability in the management of forest products.

Visitors will see the latest technologies in growing, harvesting and processing trees to maximize the benefit of the wood fibre and carbon they contain while minimizing waste.

They will also hear and see new systems, technologies and policies that employ advanced manufacturing to create new construction opportunities using prefabricated timber componentry to economically deliver high end architectural design.

With so many people encountering so many new ideas, the exhibitions, demonstrations and social events will be vital opportunities for interested people to discuss how these ideas can be put to practical use in the form of real innovation.
