

IUFRO Conference

Global Change and Forest Health

Climate change, biological invasions, air pollution, forest pathology, forest entomology, and their interactions

Date: 25 - 29 April, 2016

Venue: Istanbul, Turkey

Global change is happening all around us. Climate change is looming, the hydrologic cycle is changing, international trade and travel has reached unprecedented levels, and the distributions of species (including pests and pathogens) are changing as never before. How does all this affect our forests? Will forests be able to adapt to these threats? And to what extent can forests mitigate global change effects? These are important questions as forests are critically important for us and future generations.

Take note of this global event to share state of the art science and enjoy Istanbul.
